

2 parallel 10 series lithium battery pack production

Overview

What is the production process of lithium-ion battery cells?

"Production process of lithium-ion battery cells", this brochure presents the process chain for the production of battery modules and battery packs. ● The individual cells are connected in series or parallel in a module. Several modules and other electrical, mechanical and thermal components are assembled into a pack. Battery value chain.

How does a parallel connection increase battery capacity?

Parallel connection attains higher capacity by adding up the total ampere-hour (Ah). Some packs may consist of a combination of series and parallel connections. Laptop batteries commonly have four 3.6V Li-ion cells in series to achieve a nominal voltage 14.4V and two in parallel to boost the capacity from 2,400mAh to 4,800mAh.

What is advanced lithium battery pack design?

Advanced Lithium Battery Pack Design: These custom batteries are made when the customer has special requests for temperature capabilities, dimensions, discharge current, and/or battery cycles. In this case, our chemistries, enclosure, and battery management system (BMS) experts are required to monitor each project closely.

Why should you choose a 10s2p battery pack?

Modular and scalable design: The 10S2P configuration allows for a modular and scalable design, which means that the battery pack can be easily expanded or replaced without affecting the overall performance. This makes it suitable for applications where flexibility and versatility are important, such as solar power systems and UPS.
