#### **Overview**

Can wind-storage hybrid systems provide primary energy?

Thus, the goal of this report is to promote understanding of the technologies involved in wind-storage hybrid systems and to determine the optimal strategies for integrating these technologies into a distributed system that provides primary energy as well as grid support services.

What is co-locating energy storage with a wind power plant?

Co-locating energy storage with a wind power plant allows the uncertain, timevarying electric power output from wind turbines to be smoothed out, enabling reliable, dispatchable energy for local loads to the local microgrid or the larger grid.

What is an AC-coupled wind turbine system?

In an AC-coupled system, energy stored by the battery can be independent of the output of the wind turbine, allowing the combined system to be sized and operated based on the energy and grid services that the project will provide. Two independent units will also have a high total capacity because both units can provide full output simultaneously.

What is a wind storage system?

A storage system, such as a Li-ion battery, can help maintain balance of variable wind power output within system constraints, delivering firm power that is easy to integrate with other generators or the grid. The size and use of storage depend on the intended application and the configuration of the wind devices.

What are the advantages of a DC-based power system?

Because of these advantages, a DC-based power system with DC-coupled wind and storage is an enabling technology for microgrids, especially in small-scale residential applications such as green buildings, sustainable homes, and

energy access applications in areas inaccessible by the national grid. System efficiency and cost.

How can a hybridization of distributed wind assets overcome technical barriers?

Many of these technical barriers can be overcome by the hybridization of distributed wind assets, particularly with storage technologies. Electricity storage can shift wind energy from periods of low demand to peak times, to smooth fluctuations in output, and to provide resilience services during periods of low resource adequacy.
