

Cuba s new energy storage ratio

Overview

In 2023, Cuba's first grid-scale storage project (20 MW/80 MWh) slashed blackout frequency in Santiago by 60%. But smaller solutions matter too. How much energy will Cuba generate by 2025?

In 2019, Cuba signed an agreement with the United Nations for Project 180087, committing to generate 29% of its energy from renewable sources by 2025. The project was scheduled to conclude on June 30, 2023, with a budget of \$3.4 million. The Cuban state forecasts generating 30,000 GWh by 2030, an almost unattainable goal.

What percentage of Cuba's energy consumption is renewable?

In 2019, renewable energy accounted for around 21.5 percent of actual total consumption in Cuba. The following chart shows the percentage share from 1990 to 2019:.

How much energy does Cuba produce per capita?

Per capita this is an average of 1,430 kWh. Cuba can completely be self-sufficient with domestically produced energy. The total production of all electric energy producing facilities is 20 bn kWh, also 121 percent of own requirements. The rest of the domestically produced energy is either exported into other countries or unused.

Will Cuba build a new thermoelectric plant in 2023?

The project was scheduled to conclude on June 30, 2023, with a budget of \$3.4 million. The Cuban state forecasts generating 30,000 GWh by 2030, an almost unattainable goal. Not only are there no plans to build new thermoelectric plants, but the National Electric Union (UNE) currently supplies only 56.6% of the energy it provided five years ago.

Does the flow of the Cuban rivers increase hydroelectric generation?

The flow of Cuban rivers does not allow for a significant increase in

hydroelectric generation, which has declined since 2018. That year, 145.5 GWh were generated, compared to only 106.5 GWh in 2023. The wind energy investment plan includes installing 633 MW.
