

# **Energy storage charging station**payback period

### **Overview**

Will the charging station payback period decrease in the future?

The calculated payback periods based on the number of charging stations per vehicle provided in the study and the forecasts made using artificial neural networks indicate that the charging station payback periods will significantly decrease in the future, warranting careful consideration of the initial costs.

How long does it take for a charging station to pay back?

EY research finds that a typical charging station, with two slow (6.6kW) and two fast (50kW) chargers, will take five years to yield positive cashflow. Our analysis shows that the payback periods for charging infrastructure investments are longer than 10 years.

When does the 120-day chargeback period end?

The 120-day chargeback period ends 120 days after the credit was issued or the goods were returned or the services were canceled.

Can artificial neural networks predict payback periods for charging stations?

Cost calculations and revenue projections have been conducted based on the high growth scenario for charging stations to establish their respective payback periods. Artificial neural networks (ANN) were developed using these data, and payback periods were predicted according to the medium growth scenario.

How do charging stations make money?

The source of income covering the charging station costs is derived from electricity sales made at the stations.

How do I assess costs associated with charging infrastructure?

Optimal placement of charging station equipment. Use these tools to assess

costs associated with charging infrastructure such as: Investor payback period and risk analysis. Contact us to learn more about our EV charging infrastructure analysis capabilities or to discuss your partnership interests.
