

Energy storage system equipment composition

Overview

A battery energy storage system (BESS) contains several critical components. This guide will explain what each of those components does.

The battery is a crucial component within the BESS; it stores the energy ready to be dispatched when needed. The battery comprises a fixed number of lithium cells wired in series and parallel within a frame to create a module. The modules are then stacked and.

Any lithium-based energy storage system must have a Battery Management System (BMS). The BMS is the brain of the battery system, with its primary function being to.

The battery system within the BESS stores and delivers electricity as Direct Current (DC), while most electrical systems and loads operate on.

If the BMS is the brain of the battery system, then the controller is the brain of the entire BESS. It monitors, controls, protects, communicates, and schedules the BESS's key.
