#### **Overview**

Is battery storage better than Flywheel?

Battery Storage is typically a better choice for long-term energy storage, such as for renewable energy systems (solar or wind) or home energy storage. Flywheel technology is evolving, with several countries, including China, leading the way in large-scale flywheel installations.

How can flywheels be more competitive to batteries?

The use of new materials and compact designs will increase the specific energy and energy density to make flywheels more competitive to batteries. Other opportunities are new applications in energy harvest, hybrid energy systems, and flywheel's secondary functionality apart from energy storage.

What is a flywheel energy storage system?

Flywheel energy storage systems offer a unique and efficient alternative to traditional battery systems, with advantages in speed, lifespan, and environmental impact. While battery storage remains the dominant choice for long-term energy storage, flywheel systems are well-suited for applications requiring rapid energy release and frequent cycling.

What are the advantages of a flywheel system?

Flywheel systems have several advantages, particularly in applications requiring fast charge and discharge cycles. Rapid Charge/Discharge: Flywheels can charge and discharge electricity much faster than traditional batteries, making them ideal for balancing power grids or managing short-term fluctuations in energy demand.

Do flywheel energy storage systems need to be embedded in the ground?

Still, many customers of modern flywheel energy-storage systems prefer to have them embedded in the ground to halt any material that might escape the containment vessel. An additional limitation for some flywheel types is

energy storage time. Flywheel energy storage systems using mechanical bearings can lose 20% to 50% of their energy in 2 hours.

What happens if a flywheel is over tensile strength?

When the tensile strength of a flywheel is exceeded the flywheel will shatter, releasing all of its stored energy at once; this is commonly referred to as "flywheel explosion" since wheel fragments can reach kinetic energy comparable to that of a bullet.
