

How much does a microgrid energy storage system usually cost

Overview

How much does energy storage cost a microgrid?

In commercial/industrial and utility microgrids, soft costs (43% and 24%, respectively) represent significant portion of the total costs per megawatt. Finally, energy storage contributes significantly to the total cost of commercial and community microgrids, which have percentages of 25% and 15%, respectively, of the total costs per megawatt.

Why are microgrids becoming more expensive?

But the cost analyses are changing. Given increased spending on distribution, microgrids are starting to proliferate in different areas where the dual benefit of reliability and cost savings from storage and renewable generation are strong. How much does a microgrid cost?

Or as S&C Electric's David Chiesa puts it: "If you've seen one microgrid. you've seen one microgrid." So there is no quick and simple price to give a prospective customer. Sources we've interviewed cite project proposals as low as \$250,000 to as high as \$100 million. Generation typically accounts for most of the cost.

Is a microgrid more expensive than a small solar array?

True, larger microgrids will likely be more expensive than smaller microgrids — but in gross terms, not necessarily on a per kilowatt basis. In fact, generation for a very small microgrid tends to cost more per kilowatt than a comparable larger version. For example, a 50-kW solar array is more expensive per kilowatt than 1-MW solar array.

What is S&C Electric's cost classification based on microgrid complexity?

S&C Electric's categorization based on microgrid complexity2 The

classification by microgrid complexity shows that costs for Level 1 projects have the lowest mean, at \$2 million/MW (Table 2). The normalized costs in terms of IQR values and mean are very similar for Level 2 and Level 3, with average costs in the range from \$3.1–\$3.5 million/MW.

Are controller costs a percentage of total microgrid costs?

Controller costs as a percentage of total costs range from 0.5%-21%, a median of 7%, and one outlier with a value of 56% (Figure 20.). The analysis shows that controller cost data as a percentage of total microgrid costs have a wide range of costs among the projects in our database.
