

Indonesia hybrid energy 5G signal base station

Overview

Does a 5G base station use hybrid energy?

In this paper, hybrid energy utilization was studied for the base station in a 5G network. To minimize AC power usage from the hybrid energy system and minimize solar energy waste, a Markov decision process (MDP) model was proposed for packet transmission in two practical scenarios.

How many 5G base stations are there in Indonesia?

Most 5G deployments are still confined to urban centers, leaving large parts of Indonesia's vast geography underserved. For example, Telkomsel has launched only 2,200 5G base stations in 56 cities, out of a total footprint of more than 240,000 base stations. Despite the focus on 5G, Indonesia remains a 4G-first market.

Does Indonesia have a 5G network?

Yet, its adoption hinges on overcoming challenges like infrastructure, spectrum efficiency, and cost. Indonesia, despite having a vast user base such as that of Telkomsel, the country's largest digital communications provider, trails behind countries like Australia, which leads with a 54% 5G penetration rate.

What is the new perspective in sustainable 5G networks?

The new perspective in sustainable 5G networks may lie in determining a solution for the optimal assessment of renewable energy sources for SCBS, the development of a system that enables the efficient dispatch of surplus energy among SCBSs and the designing of efficient energy flow control algorithms.

How will a 5G base station affect energy costs?

According to the mobile telephone network (MTN), which is a multinational mobile telecommunications company, report (Walker, 2020), the dense layer

of small cell and more antennas requirements will cause energy costs to grow because of up to twice or more power consumption of a 5G base station than the power of a 4G base station.

Is there a trade-off between a 5G base station and MDP?

In addition, none of the previous works linked practical transmission scenarios for the MDP model with the study of trade-off among three elements: the minimum dropped packet ratio, the minimum the wastage of solar energy harvesting (SEH), and the minimum AC power utilization was achieved for a 5G base station using the proposed MDP method.
