

Install the communication base station inverter and connect it to the grid

Overview

How does a grid-tie inverter work?

The grid-tie inverter is configured to a solar meter which later connects to the mains. The meter is used to calculate excess energy from the inverter grid, later stored in a utility grid for future consumption.

How does an on-grid inverter work?

For an on-grid system, you will not be using batteries. Thus, unlike the off-grid systems, you will connect the inverter directly to the grid. Plug it into the main power switchboard to join the grid, which acts as the input wire. The other wire, which acts as the output wire, connects to the switchboard, which supplies the current.

How does a solar inverter synchronize with the grid?

Inverters convert the direct current (DC) generated by your solar panels into alternating current (AC) that can be used in your home. But that's not all. Crucially for this discussion, inverters also synchronize this energy with the grid, which is why understanding 'how does a solar inverter synchronize with grid' is so important.

How to install a solar inverter?

Solar inverter installation varies depending on the type of configuration. Thus, to connect the grid inverter to the mains, you must choose if it will connect directly to the battery or not. For instance, the on-grid system inverter is connected directly to the mains, while the off-grid inverter output is first connected to a storage battery.

How do you connect a grid inverter?

Most people prefer the series connection from on-grid panels because it significantly increases the voltage received by the grid inverter. To do that, you should connect the first panel's positive terminal to the second panel's

negative terminal, which connects to the third panel's positive terminal and continues the process.

What is a grid-following inverter?

Grid-following inverters continuously monitor the grid's sine wave and adjust their output to match it. These 'smart' inverters utilize cutting-edge technology to ensure there is no 'clash' between the energy from your solar setup and the grid. An electrical grid signal plays a crucial role in the synchronization process.
