

# Malaysia Communication Base Station Inverter Project

#### **Overview**

What is a base transceiver station?

Base Transceiver Stations facilitate wireless communication between a cellular device and network. A Base Transceiver Station consists of the following: Antennas that relay radio message, Transceivers, Duplexers, and Amplifiers. The antenna provides network solutions by conveying radio message.

What is a Base Transceiver Station (BTS)?

A Base Transceiver Station is part of a cellular network and has devices for encryption and decryption of antennas, spectrum filtering equipment, antennas, and transceivers (TRX) among others. A BTS has multiple transceivers to serve varying frequencies and sectors. It also has an Antenna for transmission of signals to other entities.

What is a base station controller (BSC)?

The BSC is a combination of software and hardware devices. For example, the Base Station Controller enables call setup and termination. The BTS also has an Alarm extension system that registers working status alarms of various units within the BTS. The system subsequently registers them to operations and maintenance monitoring stations.
