

Price of a string inverter

Overview

Should you buy a string solar inverter?

A string solar inverter is a popular option when investing in a PV or solar energy system. Affordable and easy to install and maintain, it provides a great solution for powering your home or business with solar energy. As you shop for a string inverter, keep in mind the power rating, efficiency, number of inputs, size, and price.

What is a string solar inverter?

The typical string inverter will have multiple strings of PV modules connected to it. Consequently, it will have multiple inputs for these connections. Some inverters are designed with just one input and are built for small solar PV systems. These are sometimes called single-string solar inverters. A multistring solar inverter has multiple inputs.

Are string inverters efficient?

Solar inverters are generally efficient, especially when fitted with MPPT. However, for the efficiency to be realized when using a string inverter, solar panels in each string must receive sunlight, or the string or output will be reduced. Given the working of string inverters, how do they compare to other solar system types?

.

How much does a solar inverter cost?

The overall cost breakdown shows that while necessary, inverters are a relatively small part of the total investment in solar technology. After applying tax credits, the total cost to install a solar system, inverter included, comes to between \$10,600 and \$26,500. In 2023, there was a 15% drop in the price of residential systems.

How much does a microinverter cost?

While they cost more than string inverters, averaging \$1.15 per watt, they offer the benefit of independent panel optimization. For a 5 kW system, the cost is approximately \$5,750. Microinverters generally come with warranties of around 25 years, which aligns with the expected lifespan of the solar panels themselves.

Can a string inverter be used with a battery?

These inverters are often used with batteries to store power for later use. Solar inverters are generally efficient, especially when fitted with MPPT. However, for the efficiency to be realized when using a string inverter, solar panels in each string must receive sunlight, or the string or output will be reduced.
