

# Profit model of grid-side energy storage

### **Overview**

Rapid growth of intermittent renewable power generation makes the identification of investment opportunities in energy storage and the establishment of their profitability indispensable. Here we first present.

The profit model of energy storage power stations operates primarily through: 1) frequency regulation, 2) capacity arbitrage, 3) ancillary market services, and 4) participation in energy trading markets. Is energy storage a profitable business model?

Although academic analysis finds that business models for energy storage are largely unprofitable, annual deployment of storage capacity is globally on the rise (IEA, 2020). One reason may be generous subsidy support and non-financial drivers like a first-mover advantage (Wood Mackenzie, 2019).

What are business models for energy storage?

Business Models for Energy Storage Rows display market roles, columns reflect types of revenue streams, and boxes specify the business model around an application. Each of the three parameters is useful to systematically differentiate investment opportunities for energy storage in terms of applicable business models.

How can energy storage be profitable?

Where a profitable application of energy storage requires saving of costs or deferral of investments, direct mechanisms, such as subsidies and rebates, will be effective. For applications dependent on price arbitrage, the existence and access to variable market prices are essential.

Why should you invest in energy storage?

Investment in energy storage can enable them to meet the contracted amount of electricity more accurately and avoid penalties charged for deviations. Revenue streams are decisive to distinguish business models when one application applies to the same market role multiple times.

Is energy storage a'renewable integration' or 'generation firming'?

The literature on energy storage frequently includes "renewable integration" or "generation firming" as applications for storage (Eyer and Corey, 2010; Zafirakis et al., 2013; Pellow et al., 2020).

Which energy technologies are the most profitable?

The most examined technologies are again CAES (27 profitability estimates), batteries (25), and pumped hydro (10). Recent deployments of storage capacity confirm the trend for improved investment conditions (U.S. Department of Energy, 2020).
