

Sine wave inverter photovoltaic

Overview

Sine wave inverters are available in two basic types: pure sine wave inverters and modified sine wave inverters. The difference is basically in the electronics. Modified sine wave inverters use simpler and cheaper electronics to produce a wave that is not quite a smooth sine wave. Pure sine wave inverters use more.

Inverters are a very important part of the transition to renewable energy. They are necessary because solar panels give a direct current (DC) power output, which basically means the current flows one way. However, nearly all of our homes and businesses use.

DC power is pretty self-explanatory. The current runs one way only. In the case of solar cells, the current will vary fairly slowly through the day as the suns' intensity changes, but the current will always flow the one way. If we plot current vs time, we get the DC graph.

Early inverters used mechanical switches to create simple versions of AC power, and there are some (cheap) inverters using mechanical switches still available today. The simplest.

Changing DC current to sine wave AC current requires more complex electronics. The figure below is a circuit diagram for a 'do-it-yourself' sine wave inverter. Sine wave inverters work.
