

# Solar panels are only a few millimeters thick

#### **Overview**

Standard solar panels are typically 30 to 40 millimeters thick. This thickness makes it essential to ensure the roof can handle the load. Larger panels, such as those measuring 2382 mm x 1134 mm (about 93.9 x 44.6 inches), weigh between 18 to 25 kg (roughly 40 to 55 lbs). How thick is a solar panel?

The thickness of the glass on the panel is usually 3.2 mm, while the thickness of the aluminum frame is usually 30-40 mm. The thickness of the silicon solar cell is usually 100 micrometers, but it can range from 200 to 500 micrometers. The thickness of the glazing material on the panel can also affect the performance of the panel.

How thick are solar panels on satellites?

The thickness of solar panels on satellites can vary depending on the size and power output of the array. For example, state-of-the-art solar arrays for spacecraft providing up to 20 kW of electrical power typically consist of 3J solar cells bonded to hinged rigid panels that are around 1 inch in thickness.

Why are solar panels so thick?

However, the thickness of solar panels is primarily due to the several layers that form a solar PV panel, rather than the solar cells, which are very thin (only a few millimeters thick). The image shows a standard monocrystalline solar PV module with 36 cells (9  $\times$  4 configuration).

How much does a solar panel weigh?

Solar panels come in a variety of sizes, but they are generally around 66 by 40 inches and weigh around 42 pounds. The frame thickness of a solar panel can vary from 32 millimeters to 40 millimeters, depending on the type of panel. However, the thickness of most solar panels is about 40 millimeters. Let's dig into it and see where it takes us.

What size solar panel do I Need?

The most common solar panel size for homes is 65 inches by 39 inches. It's important to know the thickness of your solar panels because it affects how much power they can generate. The thicker the panel, the more sunlight it can absorb, and the more power it can generate.

How are solar panels made?

Solar panels are made from a thin layer of silicon, which is a semiconductor. The thickness of the silicon layer is usually around 180 micrometers, which is about the thickness of a human hair. The silicon is then coated with a thin layer of glass, which is typically around 3-4 micrometers thick.

### Solar panels are only a few millimeters thick

## How Thick Are Solar Panels? [Updated: September 2025]

The frame thickness of a solar panel can vary from 32 millimeters to 40 millimeters, depending on the type of panel. However, the thickness of most solar panels is about 40 ...
