

Solar system low voltage protection

Overview

How to choose a DC surge protection device for solar?

There are three types of DC SPD available for solar. So, you need to choose the DC surge protection device based on your needs. The type 1 surge is designed to handle direct lightning strikes. This device is installed at the primary inlet of the power supply. Additionally, it protects a wide area.

Why should you install a solar surge protector on your PV system?

So, when you install a solar surge protector on the PV system, it helps the system run smoothly without sudden surges. As a consequence, the system delivers a better and more consistent performance. Sudden power surges lead the PV system components to degrade with time. It gradually reduces the life expectancy of the solar power system.

What is a good voltage protection level for a solar array?

To have a protective effect, an SPD's voltage protection level (Up) should be 20 % lower than the dielectric strength of the system's terminal equipment. It is important to use an SPD with a short circuit withstand current greater than the short circuit current of the solar array string that the SPD is connected to.

How do I protect my solar system from lightning & surges?

For most residential and commercial solar installations, focusing on robust lightning and surge protection using high-quality SPDs like those from Midnite Solar and Delta is the most practical and cost-effective approach. This, combined with proper grounding and bonding, will safeguard your system against the vast majority of surge events.

How a DC surge protection device helps a PV system?

So, a DC surge protection device can prevent the current from overflowing into the circuit and save these components from getting damaged. When a power surge occurs, it stops the system from running at its optimal level.

Sometimes, it also ruins the PV system components badly.

Why do solar panels have a voltage surge?

The voltage surge can occur for multiple reasons, such as lightning or internal changes in voltage use. So, as solar PV systems are susceptible to damage, voltage surges destroy the solar power's photovoltaic (PV) system components. This voltage surge also creates burning holes in the PV panels and degrades inverters.
