#### **Overview**

How can sing-phase immersion cooling reduce power consumption?

Improving flow structure is another research direction for sing-phase immersion cooling. Some structures are designed to reduce power consumption, such as multilayer flow structures, added partitions, and manifold structures. Tan et al. proposed a novel multilayer structure that introduced cross-flowing.

Can immersion cooling be a core solution for next-generation battery thermal management?

In the future, through interdisciplinary collaboration (material science, fluid dynamics, and electrochemistry) and the integration of advanced technologies, coupled with intelligent and environmentally friendly design, immersion cooling can be developed into a core solution for next-generation battery thermal management.

What is immersion cooling?

The latest developments, challenges and future directions for immersion cooling are reviewed and presented. Different dielectric fluids are evaluated for immersion cooling. Immersion cooling demonstrates the best temperature uniformity. Immersion cooling exhibits the lowest carbon footprint in the battery lifecycle analysis.

Does immersion cooling reduce energy costs?

As a result, the two-phase cooling system reduces power consumption and lowers overall system costs . According to data published by immersion cooling data centers, the two-phase immersion cooling system can reduce total energy costs by  $15-25\,\%$  compared to traditional air cooling systems .

Can immersion cooling be used in data centers?

Although immersion cooling has achieved significant advancements in data

centers, its application in areas such as EVs and ESS is still in the experimental or prototype stage due to challenges such as fluid weight, leakage concerns, and regulatory compliance.

How does a two-phase immersion cooling system work?

In a two-phase immersion cooling system, the high-temperature environment facilitates the heat necessary for boiling. Consequently, phase transition processes can occur at a low C-rate, maintaining battery temperature at the boiling point.
